

CERVICAL CANCER AWARENESS MONTH

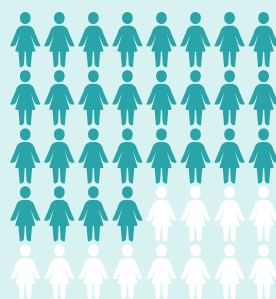

January is Cervical Cancer Awareness Month – an entire month dedicated to raising awareness about cervical cancer and encourage women to get screened.

2026 JAN

NEWSLETTER

Compiled by: Cerba Lancet Africa and Kenyan Editorial Teams

- Cervical cancer is the **most common cancer among women** in Uganda and the leading cause of female cancer deaths.
- Every year, an **estimated 6,959 women are diagnosed** with cervical cancer, and around 4,607 women die from it.
- Cervical cancer **ranks first among all cancers in Ugandan women**, and also first among women aged 15–44.

- Around **11 million women** in Uganda are at risk of developing cervical cancer due to HPV infection.
- Cervical cancer accounts for about 35–37% of **all new cancer cases among Ugandan women**.

HPV and Cervical Cancer

- HPV (Human Papillomavirus) has been established as the **cause of cervical cancer**. It is spread through close sexual contact.
- Most HPV infections clear on their own, but in some women the infection persists, leading to the risk of progression to cervical cancer.
- Some HPV types carry a higher risk of causing cervical cancer (HR-HPV). These include HPV types 16&18, which cause >70% of cervical cancer.
- Testing for the presence of HPV allows a woman to know whether she is at risk or not. A woman who is not infected with HR-HPV is not at risk of developing cervical cancer.
- The HPV test ensures that those who are positive and at risk can be identified early and treated before they progress to cervical cancer.

DID YOU KNOW?

Merits of HPV DNA PCR Test

- Recommended as the primary screening test for cervix cancer in women 30 years and above by the WHO guidelines.
- More sensitive than PAP smear (>95% sensitive compared to < 60% for PAP).
- Does not require a speculum.
- Can be done on both self collected sample and one collected by your gynaecologist.
- Automated test (not operator dependent)
- Quicker results.

EVALYN-BRUSH® HPV TEST

Cerba Lancet Uganda has introduced a self-collection kit that any woman can use to collect a sample by herself for HPV testing.

The self-collection kit is Evalyn-Brush® which is specially patented for collecting material from the vagina. The Evalyn-Brush® has soft, fine bristles, ensuring that enough fluid and cell material is collected for testing in the lab. Evalyn-Brush® was designed by women for women.

Self-collected sample using the Evalyn-Brush® has been confirmed to be as accurate as a cervical sample collected by a gynaecologist or a nurse.

How Do I Use the Evalyn-Brush

- 1 Remove the Evalyn-Brush® from the packaging. Do not throw the packaging away, as it is necessary for sending the Evalyn-Brush® to the laboratory after usage.
- 2 Press the sides of the pink cap with your thumb and index finger to remove the pink cap from the Evalyn-Brush®. Ensure that you do not touch the white fibres of the Evalyn-Brush® with your hands!
- 3 Insert the Evalyn-Brush® up to the wings, push the plunger rotate x 5. Carefully remove the Evalyn-Brush® and replace the pink cap.
- 4 Place the Evalyn-Brush® back inside the original package. Put the package containing the Evalyn-Brush® into the plastic bag provided, seal it then submit to the laboratory.

Test Results

- Results are available within 1-2 days.
- Results can be sent via email.
- Results interpretation assisted by a trained staff.
- The prevalence of hr-HPV was 16.67%. Other hr-HPV types other than HPV 16 and 18 were predominant, with a prevalence of 10.6%; HPV 18/45 (2.31%), HPV 16 (0.46%)

What Do My HPV Results Mean?

- If the HPV test result is negative, you are NOT at risk of developing cervical cancer, and you do not need to test again for 3-5 years.
- If the HPV test is positive, you need to see a gynaecologist for further management.
- If positive for HPV 16 or 18, colposcopy should be done for biopsy or treatment on the spot.
- If positive for any other 12 HR-HPV subtypes (other than 16 or 18), a PAP smear will be done to guide the gynaecologist on further management.

Why Use the Evalyn-Brush

- Validated for HPV DNA PCR-based testing.
- Suitable for women across all age groups.
- Does not require a speculum.
- Option for self-collection at the privacy of one's home.
- Built-in features to assure correct sample taking.
- Flexible bristle technology for comfort and maximum yield.
