Clinical Interest

Apolipoprotein A1 (ApoA1) is the major protein component of high-density lipoprotein (HDL) in plasma and plays a crucial role in lipid metabolism and cardiovascular health. It is of significant clinical interest for several reasons, including its role in cardiovascular disease (CVD) risk assessment, its potential therapeutic applications, and its emerging roles in other diseases and conditions.

Low ApoA1 levels have been associated with worse outcomes in various conditions, including acute coronary syndrome and heart failure. Monitoring ApoA1 levels could therefore aid in the prognosis and management of these patients.
